Extra Bonus 3 (5%)

Implement the least-squares Monte Carlo simulation to value American-style plain vanilla puts, lookback puts, and arithmetic average calls.

- Inputs for plain vanilla puts: S_0 , K, r, q, σ , T, n.
- Inputs for lookback puts: S_t , r, q, σ , t, T, n, $S_{\max,t}$.
- Inputs for arithmetic average calls: S_t , K, r, q, σ , T-t, M, n, $S_{\text{ave},t}$, passing_time.
- Outputs: Option values and 95% confidence intervals.
